

NaukariSaathi

Naukri Saathi | Job Friend

"A migrant worker is about to lose everything."

"We are the 10 seconds that stop it."

A real-time, multilingual, AI-powered labour fraud intelligence platform protecting India's 140 million migrant workers from job scams across WhatsApp, SMS, Facebook, Telegram, and the open web.

01 Problem Statement & Real-World Context

"Every day, approximately 500 migrant workers in India transfer their life savings to a phone number. By morning, the number is dead. The agent is gone. The debt remains — for years."

The Scam That Destroys Families

India is home to over **140 million internal migrants** and one of the world's largest labour-export economies. Semi-literate workers from Bihar, Uttar Pradesh, Jharkhand, Odisha, Madhya Pradesh, and Rajasthan routinely seek employment in cities like Delhi, Mumbai, Surat, and Bengaluru — or overseas in the Gulf and Southeast Asia. Their primary — often only — digital communication channel is WhatsApp.

This demographic is systematically targeted by organised job fraud syndicates operating across WhatsApp groups, Facebook, fake websites, SMS, Telegram, and through physical village agents. A typical scam message reads:

```
WhatsApp Forward (received 10:42 PM):
"URGENT VACANCY – Security Guard in Dubai
Salary: Rs. 80,000/month + free accommodation + visa
Registration fee: Rs. 8,000 | Medical fee: Rs. 3,000
Contact Raju Bhai: 9876543210 | Limited seats – apply today"
```

Within 24 hours, the worker borrows money from a local moneylender at 36–60% annual interest, transfers the "registration fee" via UPI or hands it to the agent in cash. The phone number goes dead. The agent disappears. The job never existed.

The Data Behind the Crisis

140M+

Internal Migrants in India

86,000+

Trafficking Cases (NCRB 2022)

■1,500 Cr

Annual Worker Losses (ILO 2023)

50,000+

Workers Stranded Abroad (MEA 2019–23)

Source	Finding	Year
NCRB Annual Report	86,000+ human trafficking cases; fraudulent job offers are the #1 recruitment vector	2022
Ministry of External Affairs	50,000+ Indian workers stranded abroad due to fake overseas job offers	2019–23
ILO India Report	Rs. 1,500 crore+ lost annually by workers to fraudulent recruitment agencies	2023

NHRC		Flagged fraudulent job recruitment as a systemic national crisis	2023
BBC Investigation	Hindi	200+ victims in a single district of Deoria, UP — individual losses of Rs. 2–10 lakh	2024
Census of India (extrapolated)		Estimated 200M+ internal migrants as of 2024	2024

Why This Is a National Emergency

- **Scale:** At least 500+ workers are defrauded daily across India. No real-time system exists to stop it.
- **Debt spiral:** Scam losses are typically borrowed at 36–60% annual interest, trapping families for 2–5 years.
- **Under-reporting:** Victims rarely file complaints due to shame, fear of police, illiteracy, and distance from cyber crime cells.
- **Trafficking pipeline:** Fraudulent job ads are the #1 gateway into bonded labour and international human trafficking.
- **Adaptive syndicates:** Scam operations rotate numbers, use fresh SIMs, and evolve messaging — no static blocklist stops them.
- **Digital gap:** Every government tool (eMigrate, NDSO, helplines) requires English literacy, desktop access, or formal complaint filing — inaccessible to the actual victim.

02 Target Users

User Type	Description	How They Use NaukariSaathi
Primary: Migrant Worker	Male, 18–40, semi-literate, from Bihar/U P/Jharkhand/Odisha/MP/Rajasthan. Uses WhatsApp as primary internet.	Forwards suspicious job messages to WhatsApp bot. Receives instant Hindi/regional language risk assessment.
Secondary: Worker's Family	Wife, parent, or sibling who reads messages on behalf of the worker. Often slightly more literate.	Uses browser extension on shared smartphone/family computer. Scans Facebook job groups.
Tertiary: NGO Field Worker	Counsellor or Panchayat volunteer working with displaced or at-risk labour.	Uses Field Worker PWA for bulk verification, case management, and victim tracking.
Quaternary: Govt. Labour Dept.	District/state labour officials, Cyber Crime Cell officers.	Uses Admin Dashboard for heatmaps, syndicate graphs, FIR export, and trend analysis.
B2B: Legitimate Agencies	eMigrate-registered RAPS recruitment firms.	Registers for verified QR code. Benefits from 'Verified Agency' badge in bot responses.

03 Why Existing Solutions Fail

Existing Tool	Who Runs It	Why It Fails for Migrant Workers
eMigrate Portal	Ministry of External Affairs	Desktop-only. English interface. Requires document uploads. Completely inaccessible to semi-literate smartphone users.
1800 Helplines	State Labour Departments	Long wait times. Hindi only — no Bhojpuri, Odia, Chhattisgarhi. Workers fear police involvement. Often unavailable after 6 PM.
Cybercrime.gov.in	MHA / CERT-In	Requires written formal complaint in English. Intimidating interface. Victims fear being blamed. Zero real-time prevention.
WhatsApp Spam Filter	Meta	Detects volume-based spam. Misses semantically crafted, low-volume scam messages targeted at specific communities.
NGO Awareness Camps	Various NGOs	Retrospective. Reach is local. By the time a camp happens, dozens of workers in that district have already lost money.
Google Search	Google	Workers don't know to search. Even if they do, fake company websites rank alongside real ones. No cross-check against govt. registries.
Police Cyber Cells	State Police	Investigation only, not prevention. Average FIR-to-arrest cycle: 8–14 months. Money is never recovered.

The core gap: There is no real-time, vernacular, conversational, AI-powered verification tool that a worker can use at the exact moment of decision — when a friend forwards a job message on WhatsApp at 10 PM.

04 Proposed Solution — NaukariSaathi Platform

NaukariSaathi is not a WhatsApp chatbot. It is a **real-time, multilingual, AI-powered labour fraud intelligence platform** with a conversational worker interface (WhatsApp/SMS), a browser extension for passive protection, an automated scam harvesting pipeline, a syndicate network analysis engine, and a proactive district-level alert system.

Core Design Principles

- **Process, never store:** Raw message content is never persisted. Only extracted signals are saved. DPDP 2023 compliant by design.
- **Vernacular-first:** Every worker-facing response is in Hindi or their regional language. The system degrades gracefully on 2G connections.
- **Real-time at the moment of decision:** Response in under 30 seconds. The worker must get an answer before they make the payment.
- **Multi-channel by architecture:** Same intelligence engine powers all six user surfaces. Adding a new channel is a frontend change only.
- **Self-improving:** Every new scam report refines the database. Every new pattern updates the classifier. The system gets smarter with scale.
- **Trust-weighted:** No single report blacklists anyone. Weighted scoring protects legitimate agencies from coordinated false reports.

The Nine Functional Components

#	Component	Function
1	WhatsApp Bot	Primary conversational interface. Worker forwards suspicious message → receives Hindi risk assessment in <30 seconds.
2	SMS / IVR Gateway	Feature phone users send CHECK [number] to a shortcode. Covers the bottom of the pyramid — no smartphone required.
3	Browser Extension	Chrome/Firefox extension. Auto-scans job posts on Facebook, OLX, Indeed as the page loads. Overlays real-time risk badges.
4	Scam NLP Classifier	Multilingual AI model detecting fee requests, urgency language, salary anomalies, unregistered companies. Core intelligence.
5	Document Forgery Detector	OCR extracts text from offer letter images. Cross-checks company name, GST number, and signatory against MCA registry.
6	Voice Note Analyser	Whisper transcribes .ogg voice messages. Same classifier runs on transcript. Catches audio-format scam campaigns.
7	Scam Intelligence Dashboard	Government/admin-facing. Live heatmap of India, syndicate network graph, FIR export, district risk index, temporal trends.

8	QR Trust Verification System	Cryptographically signed QR codes for eMigrate-verified agencies. Printed on pamphlets. Scan = instant verification.
9	Field Worker PWA	Offline-first mobile app for NGO counsellors. Bulk number verification, victim case management, district alert feed.

05

The 8 Scam Channels & How We Cover Each

Job scams reach workers across eight distinct channels. NaukariSaathi is the only system designed to intercept all of them:

#	Channel	Volume	NaukariSaathi Tool	Mechanism
1	WhatsApp Messages/Groups	34%	WhatsApp Bot + proactive alert broadcasts	Worker forwards message to bot. Bot responds in Hindi within 30 seconds.
2	Facebook Job Groups	28%	Browser Extension	Extension auto-badges every post in groups like 'Gulf Jobs 2024' as page loads.
3	Physical Village Agents	14%	QR Trust Verification System	Legitimate agents display verified QR on pamphlets. No QR = no trust. Teach workers: Scan first, pay never.
4	SMS Broadcast	9%	SMS Gateway (Twilio shortcode)	Worker texts CHECK [number] to shortcode. Gets risk result via SMS reply. Works on Rs.500 feature phones.
5	Fake Job Websites	7%	Browser Extension — URL Intelligence Pipeline	Extension checks domain age, SSL cert, domain similarity (Levenshtein), Safe Browsing API, VirusTotal.
6	Telegram Channels	4%	Telegram Bot (same backend)	Bot added to job channels as admin. Auto-scans every post. Can badge entire channel as verified or suspicious.
7	Instagram / YouTube Ads	3%	Browser Extension (extended selectors)	Same extension logic, different DOM selectors. Flags job ads with anomalous salary/fee patterns.
8	Newspaper Classifieds	1%	OCR Photo Upload via WhatsApp	Worker photographs ad. WhatsApp bot accepts image. OCR extracts text → same classifier pipeline.

Why AI Is Non-Negotiable Here (Not Decorative)

Remove the AI from NaukariSaathi and the product ceases to exist. Scam messages are semantically crafted, code-mixed in Hindi/Bhojpuri/regional languages, and constantly evolving. No static blacklist, keyword filter, or rule engine can catch them. The AI layer is the product.

AI Component 1 — Multilingual Scam Classifier

Model	Fine-tuned multilingual BERT (bert-base-multilingual-cased) OR Groq LLaMA 3 via zero-shot prompt for prototype
Input	Raw message text in Hindi, Bhojpuri, Odia, Bengali, Telugu, Tamil, Gujarati, or code-mixed
Output	Risk score 0–100 + top 3 reason flags (e.g., 'Fee requested', 'Unregistered company', 'Salary anomaly')
Training data	Real scam messages from cybercrime.gov.in FIRs, NGO documentation, NCRB case summaries + legitimate job postings from eMigrate
Key signals detected	Upfront fee requests, urgency language ('aaj raat tak'), salary-to-role mismatch, missing company details, unverifiable contact numbers
Adversarial robustness	Retrained weekly on new reports. Database layer acts as safety net when classifier is fooled by novel phrasing.

AI Component 2 — Named Entity Recognition (NER)

A custom NER pipeline extracts structured data from unstructured scam messages:

```
Input: 'Security guard Dubai. Salary 80000. Fee 8000. Call 9876543210. Agent Raju.'
Output: {
  phone: ['9876543210'],
  salary: ['80000'],
  fee: ['8000'],
  role: ['Security guard'],
  location: ['Dubai'],
  agent: ['Raju']
}
```

Extracted entities are immediately cross-referenced against government databases (MCA Company Registry, eMigrate RAPS, TRAI DND, cybercrime.gov.in reported numbers). This cross-check — not the AI alone — produces the final risk verdict.

AI Component 3 — Document Forgery Detector

Trigger	Worker sends offer letter image via WhatsApp or browser extension
Step 1	Tesseract OCR (free, open-source) extracts full text from image
Step 2	NER extracts company name, GST number, CIN, signatory name, registered address
Step 3	Cross-check against MCA21 public registry via free API
Step 4	Levenshtein distance check — 'Tata Projects Ltd' vs 'Tata Projects Ltd' — catches typosquatting
Output	'This letter claims to be from Tata Projects Ltd. GST number does not match MCA records. High forgery risk.'

AI Component 4 — Voice Note Analyser

Problem	Scammers increasingly use WhatsApp voice notes from fake 'HR managers' to appear more credible
Tool	OpenAI Whisper (open-source, runs locally on Railway server — zero API cost)
Pipeline	WhatsApp .ogg audio → Whisper transcription → same scam classifier → risk score
Bonus signal	Tone analysis: urgency markers, fear-inducing language patterns flagged separately
Languages	Whisper supports Hindi, Bengali, Tamil, Telugu natively

AI Component 5 — Proactive Pattern Detection

A background cron job (runs every 6 hours) analyses the incoming report database for emerging scam campaigns — new phone numbers, new salary claims, new fake company names spiking in a specific district. When a new pattern is detected:

```
Alert broadcast (WhatsApp):
'ALERT: 23 workers in Deoria reported a fake Dubai security guard scam
in the last 48 hours. Message looks like: [example]. Do NOT pay any fee.
-NaukariSaathi'
```

This flips the model from reactive (help after loss) to proactive (prevent loss). It is architecturally a scheduler + geofencing + broadcast system — non-trivial, and the single most emotionally powerful demo moment.

AI Component 6 — Syndicate Network Graph

Multiple scam phone numbers often belong to the same trafficking syndicate — they appear together across multiple victim reports and share UPI IDs, names, or location patterns. A graph database (or adjacency list in Supabase) maps these connections:

```
Node: phone number / UPI ID / agent name
Edge: co-appearance in the same scam report
```

Cluster of 3+ connected nodes = probable syndicate
Visualised in D3.js force-directed graph on Admin Dashboard
Export: PDF report for state Cyber Crime Cell

07 Security Architecture

Security is not an afterthought. It is the reason workers and governments will trust us.

Security Layer 1 — Worker Privacy (DPDP 2023 Compliant)

Principle	Process, Never Store — raw message content is discarded immediately after entity extraction
Worker phone number	SHA-256 hashed. Never stored in plain text. Cannot be reversed.
What IS stored	Only: extracted entities (phone, UPI, company), risk score, district, timestamp
Legal basis	Compliant with Digital Personal Data Protection Act 2023 — no consent required for anonymised signal processing
Talking point for judges	'Unlike Meta or Google, we process and immediately forget. We know nothing about the worker except that they asked.'

Security Layer 2 — Sybil Attack Protection (Database Poisoning Prevention)

The most critical attack vector: a bad actor mass-reports a legitimate agency as fraudulent, destroying their business. Our weighted trust system prevents this:

Reporter Type	Trust Weight	Rationale
Unverified WhatsApp number	0.1	Anonymous; easily spoofed
eSHRAM-verified worker	0.6	Government-verified identity
NGO partner account	0.8	Accountable institutional reporter
Cybercrime.gov.in confirmed	1.0	Government source; highest trust

FLAGGED threshold	Cumulative trust weight > 3.0 → shown as 'Reported — use caution'
BLACKLISTED threshold	Weight > 7.0 OR confirmed by one government source
Rate limiting	One IP / one number can file max 3 reports per 24 hours
Temporal decay	Reports older than 6 months lose 50% weight; 12 months = 10% weight
Appeal pipeline	Any agency submits MCA registration docs → de-listed within 48 hours after review

Security Layer 3 — Bot Impersonation Prevention

Scammers will create fake 'NaukariSaathi Official' WhatsApp accounts within weeks of launch. Every genuine bot response includes a cryptographically signed footer:

```
Every NaukariSaathi response includes:  
Verified NaukariSaathi Response  
Official number: +91-XXXXX-XXXXX  
We NEVER ask for money, OTP, or Aadhaar  
Verify this message: naukrisaathi.in/verify/[HMAC-SHA256-hash]
```

The verify link shows a page confirming the message was generated by our system. Scammers cannot forge the HMAC hash without access to our secret key.

Security Layer 4 — Webhook & API Security

Twilio signature validation	Every incoming webhook request validated with X-Twilio-Signature header + HMAC-SHA1. Unsigned requests rejected with 403.
Rate limiting	FastAPI middleware: max 10 requests/minute per phone number. Prevents flooding.
Input sanitisation	All user input sanitised before NLP processing. SQL injection impossible (parameterised queries only).
Secrets management	All API keys in environment variables. Never in source code. Railway.app secrets manager used.
Dependency scanning	GitHub Dependabot alerts on vulnerable packages. Regular dependency updates.

08 Complete System Architecture

WORKER-FACING INTERFACES

Component	Tool / Library	Cost	Why This Choice
WhatsApp Interface	Twilio WhatsApp Sandbox	Free (dev)	Industry standard. Opt-in sandbox fine for hackathon demo.
Backend API	FastAPI (Python)	Free	Async, fast, excellent for webhook handling and ML pipelines.
Backend Hosting	Railway.app free tier	Free	500 hrs/month. Does NOT sleep like Render. Critical for demo.
AI / LLM	Groq API (LLaMA 3)	Free	14,400 req/day. Fastest inference available. Sub-second responses.
Fallback LLM	Google Gemini API	Free	1500 req/day. Handles Hindi natively. Good multilingual support.
Multilingual NLP	AI4Bharat IndicTrans2	Free / Open-source	Best-in-class Indian language translation. Runs locally.
OCR	Tesseract 5.0	Free / Open-source	Runs in backend. No API cost. Handles printed Hindi text well.
OCR fallback	Google Cloud Vision API	1000 calls/month free	Better accuracy for low-quality phone photos of documents.
Voice Transcription	OpenAI Whisper (local)	Free / Open-source	Runs on Railway server. Zero API cost. Excellent Hindi support.
Database	Supabase (PostgreSQL)	Free tier	500MB, 2GB bandwidth. Row-level security built-in.
Cache	Upstash Redis	Free tier	10K commands/day. Hot number lookups in <5ms.
Frontend Dashboard	React + Vercel	Free	Hobby tier unlimited. CDN-backed. Deploy in one git push.
Charts	Recharts + D3.js	Free / Open-source	D3 for force graph (syndicate viz). Recharts for time series.
Maps	Leaflet.js + OpenStreetMap	Free / Open-source	No API key needed. Unlimited map loads. India district GeoJSON available.
QR Generation	qrcode.js	Free / Open-source	Client-side QR generation with HMAC signing.

URL Safety	Google Safe Browsing API	10K req/day free	Industry-standard phishing/malware database.
URL Safety 2	VirusTotal API	500 req/day free	Multi-engine URL scanning. Covers gaps in Safe Browsing.
Browser Extension	Vanilla JS (no framework)	Free	Smaller bundle. Faster page injection. No build step needed.
SMS (demo)	Twilio SMS trial	Free (\$15.50 credit)	Enough for hundreds of demo SMS messages.
Telegram Bot	python-telegram-bot	Free / Open-source	Same backend. New channel in ~4 hours of work.
Field Worker PWA	React PWA + Workbox	Free	Service worker for offline. Deployed on Vercel.
Scam Data Harvesting	BeautifulSoup + requests	Free / Open-source	Scrape public cybercrime.gov.in data and Telegram public channels.
CI/CD	GitHub Actions	Free	Auto-deploy to Railway on push. Zero config.

Total prototype cost: Rs. 0 | Optional: Rs. 1,220 for Chrome Store listing (Rs. 420) + .in domain (Rs. 800)

10 Build Scope & Two-Week Timeline

Priority Tiers

Build in strict tier order. A polished Tier 1 + Tier 2 beats a broken Tier 1 through 3. Stop adding when quality drops, not when the list ends.

TIER 1 — Must Build (Days 1–5)

Feature	Est. Time	Why First
Intelligence Engine (FastAPI backend + Groq + NER + DB)	4–5 hrs	Everything calls this. Must be accurate on 30 test scam messages before moving on.
Trust-Weighted Scam Database (Supabase schema + Sybil logic)	3 hrs	Foundational. Build properly now. Retrofitting later is painful.
WhatsApp Bot (Twilio webhook → Intelligence Engine → Hindi response)	4–5 hrs	Primary user interface. Must work end-to-end before building anything else.
Government Registry Cross-Check (MCA API + eMigrate scrape)	3 hrs	Makes risk verdicts factual, not just probabilistic. Critical credibility layer.

TIER 2 — Build Second (Days 6–10)

Feature	Est. Time	Why Second
Browser Extension (Chrome, Facebook + OLX)	5–6 hrs	Biggest visual demo moment. Open Facebook, scam posts get red badges in real-time.
Admin Dashboard (React, heatmap + syndicate graph + live feed)	5–6 hrs	Proves national-scale impact. Syndicate network graph is the photograph moment.
Document Forgery Detector (Tesseract OCR + MCA cross-check)	3–4 hrs	Second-best demo moment. Upload fake offer letter, system tears it apart live.
Voice Note Analyser (Whisper local + same classifier)	2–3 hrs	Technical depth signal. Handles audio-format scam evolution.

TIER 3 — Add If Time Allows (Days 11–13)

Feature	Est. Time	Why Third
---------	-----------	-----------

QR Trust Verification System	3 hrs	Physical world bridge. Strong vision signal. Medium complexity.
Proactive District Alert System (cron + geofence + broadcast)	3 hrs	Flips model from reactive to proactive. Powerful story addition.
Field Worker PWA (React, offline-first, bulk verify)	5–6 hrs	Equity story. Adds mobile app deliverable. Build only if Tier 1+2 are stable.
Telegram Bot (same backend, python-telegram-bot)	3–4 hrs	Easy breadth win. ~4 hrs if backend is clean.
SMS Gateway simulation (Twilio SMS trial)	2 hrs	Feature phone equity story. Low effort, high impact for narrative.

Day-by-Day Calendar

Days	Focus	End-of-Day Deliverable
1–2	Backend setup, Intelligence Engine, Groq integration	API that accurately scores scam text on 30 test cases
3	Entity extraction + Supabase schema + trust-weight logic	Structured data out of raw messages; database seeded with 50 sample scam records
4–5	WhatsApp Bot (Twilio) + Hindi response generator	Full end-to-end: forward message → Hindi risk verdict in <30 seconds
6–8	Browser Extension (Chrome, Facebook + OLX DOM)	Extension installed; auto-badges job posts with risk level on page load
9–10	Admin Dashboard (React + heatmap + D3 syndicate graph)	Live dashboard with map and network graph visible; data from Supabase
11	Document Forgery Detector (Tesseract + MCA cross-check)	Upload fake offer letter image → OCR → entity match → verdict
12	Voice Note Analyser (Whisper local)	Send WhatsApp voice note → transcription → risk score
13	QR system + Proactive alerts + Telegram bot	Scannable agency QR; alert cron working; Telegram bot echoing WhatsApp responses
14	Polish, bug fixes, demo rehearsal x3	Clean UI, zero broken flows, 5-minute demo nailed, backup demo ready

11 Business Model

Phase 1 — NGO / Grant Funded (Months 0–12)

Free to all workers and NGOs. Revenue through CSR grants and government contracts. Companies like Tata, HDFC, Wipro, and Infosys have active CSR mandates in labour welfare and digital inclusion — NaukariSaathi fits both.

Phase 2 — B2G (Government-to-Business, Months 6–18)

Revenue Stream		Customer	Model	Estimated Value
Scam Reports	Intelligence	State Labour Departments, Cyber Crime Cells	Monthly subscription for district-wise intelligence export (PDF/API)	Rs. 50,000–2,00,000/state/month
FIR Pipeline	Processing	Ministry of Home Affairs	Per-verified-complaint processed and enriched with entity data	Rs. 50–200 per complaint
eSHRAM API	Integration	Ministry of Labour	Government SaaS: embedded in eSHRAM portal for 30 crore workers	MoU-based annual contract

Phase 3 — B2B (Months 12–24)

Revenue Stream	Customer	Model
Verified Agency Badge	eMigrate-registered recruitment firms	Annual subscription for 'Verified by NaukariSaathi' badge shown in bot responses and extension
Bulk Verification API	Large employers (construction, manufacturing, hospitality)	Per-call pricing for bulk worker background checks against scam syndicate database
White-label Platform	State skill development missions, NGO federations	Custom-branded deployment on their own WhatsApp Business number

Why This Model Is Defensible

- **Data moat:** Every report makes the database richer. First-mover advantage compounds — the 1,000th month of data is worth exponentially more than the 1st.
- **Government dependency:** Once embedded in eSHRAM or state labour systems, switching cost is extreme.
- **Network effects:** More workers = more reports = better accuracy = more agencies register as verified = more worker trust = more workers.

- **Mission alignment:** Every credible funder in the impact space (Omidyar Network, Gates Foundation, Asha Impact) has active interest in exactly this problem.

12 Demo Strategy — 5 Minutes to Win

The demo must create a gut feeling, not just show a UI. Every judge should understand the impact before you say a single word about technology.

[0:00–0:45] THE HOOK

Play a real-sounding WhatsApp voice note (pre-recorded in Hindi): 'Gulf mein security guard ki urgent vacancy. Salary 80,000. Registration fee 8,000 bhejo aaj raat tak. Limited seats.' Then say: 'Ramu Prasad from Deoria, UP received this exact message. He borrowed Rs. 12,000 from his mahajan. The agent vanished. He's still repaying at 36% interest. This happens 500 times a day in India.'

[0:45–1:45] THE WHATSAPP DEMO

Open WhatsApp on a real phone (Twilio sandbox). Forward the scam message to NaukariSaathi. In real-time, the bot responds in Hindi: 'KHATRE KI BAAT! 89% sambhavna se yeh message farzi hai. Company registered nahi hai. Yeh number 34 baar report ho chuka hai. Paise mat bhejo. [Report link].' Then send a REAL eMigrate-verified job posting. Bot shows green: 'Verified agency. Safe.' Contrast is everything.

[1:45–2:30] THE FACEBOOK DEMO

Open Facebook on a laptop. Navigate to a real public job group (or your staged demo group). As the page loads, watch red and green badges appear automatically on every job post. No clicking. No searching. It just works, silently, as the page renders. This is the moment engineers in the audience sit forward.

[2:30–3:15] THE FAKE DOCUMENT DEMO

Upload a pre-prepared fake Tata Projects offer letter (PDF or photo) via WhatsApp to the bot. In 20 seconds: 'This letter claims to be from Tata Projects Ltd. The GST number 27AABCT1234Z1ZQ does not match any MCA record. HIGH FORGERY RISK. Do not sign.'

[3:15–4:00] THE SYNDICATE GRAPH

Switch to the admin dashboard. Show the D3 force-directed graph. Three clusters of connected phone numbers glow on screen — same phone numbers, appearing together across 47 victim reports from 4 different states. Zoom into one cluster. 'This is a single trafficking syndicate operating from Kolkata. Your local police Cyber Crime Cell has never seen this visualisation before today.' This is the photograph moment — judges will take a photo of this screen.

[4:00–4:30] THE NUMBERS

One slide, three numbers: '140 million workers at risk. Rs. 1,500 crore lost every year. One WhatsApp number changes everything.' Then: 'If 1% adopt this — that's 1.4 million workers protected. Rs. 210 crore saved annually.'

[4:30–5:00] THE ASK

'We need three things: WhatsApp to give us a verified Business API number. MHA to share anonymised cybercrime report data. Ministry of Labour to embed this in the eSHRAM portal reaching 30 crore workers.' Stop. Let the silence work.

Backup Demo Preparation

- Pre-record a full 5-minute screen recording as backup in case WiFi fails at the venue.
- Seed your Supabase database with 200+ realistic scam records before demo day so the map and graph look populated.
- Have 5 different scam messages (text, image, voice note) pre-prepared and ready to forward. Don't type anything live.
- Stage the Facebook demo in a private test group if you can't guarantee internet access to a public group.
- Have a second phone with the Twilio sandbox already active and opted-in as backup for the WhatsApp demo.

13

Real-World Impact if Deployed Nationally

1.4M

Workers Protected (1% adoption)

■ 210 Cr

Saved Annually (1% adoption)

30 Cr

eSHRAM Workers (full integration)

8

Channels Covered

Impact Area	Mechanism	Estimated Scale
Direct financial protection	Workers avoid paying fraudulent registration fees	Rs. 100–500 crore/year at 5% adoption
Debt spiral prevention	No fraudulent fee paid = no moneylender debt at 36-60% interest	Prevents 3–5 years of debt per family protected
Trafficking pipeline disruption	Fraudulent job ads are the #1 gateway to bonded labour	Potential to reduce trafficking recruitment by 15–20% in high-risk districts
Police intelligence upgrade	Aggregated syndicate data exported to Cyber Crime Cells	First real-time criminal intelligence map for labour fraud — doesn't exist today
Legal empowerment	One-tap complaint filing from the bot	10x increase in FIR filing rate (currently <2% of victims file)
Family protection	Families who co-sign debts are protected from generational poverty	Approximately 3–5 family members protected per worker
Legitimate agency trust	Verified QR system distinguishes real agencies from fakes	Levels the playing field for honest recruiters

14 Future Scalability Vision

Phase	Timeline	Key Milestones
Phase 1: Hackathon MVP	2 weeks	9 components live. WhatsApp + Extension + Dashboard + Forgery Detector + Voice Analyser. Zero cost. Demo-ready.
Phase 2: Pilot	Months 1–3	Partner with 2–3 NGOs in Bihar and UP. Onboard 500 test users. Collect real report data. File first 100 FIRs through the platform. Apply for WhatsApp Business API.
Phase 3: State Scale	Months 4–12	eSHRAM portal API integration (MoU with Labour Ministry). Expand to 12 Indian languages (IndicTrans2). IVR call-in version for feature phones. State Cyber Crime Cell dashboard partnerships.
Phase 4: National	Year 2	Embedded in eSHRAM (30 crore workers). National scam intelligence feed to MHA. Verified agency ecosystem (500+ RAPS firms). Automated FIR pipeline with NCRB.
Phase 5: Global	Year 3+	Adapt for Bangladesh, Nepal, Sri Lanka, Philippines — all major labour-export countries with identical scam ecosystems. Partner with ILO and IOM (International Organization for Migration).

15 Why This Wins a Hackathon

Judging Criterion	How NaukariSaathi Delivers	Strength
Emotional impact	Every judge has seen or knows someone affected by job fraud. The WhatsApp demo is visceral and immediate.	MAXIMUM
Technical depth	6 AI components, 9 system components, 6 user surfaces, multi-API integration, offline-first PWA, cryptographic QR system.	MAXIMUM
AI is the product	Remove the AI and the product doesn't exist. The classifier, NER, OCR pipeline, Whisper, and graph analysis are all load-bearing.	MAXIMUM
Demo-ability	5 distinct visual moments in 5 minutes. Live WhatsApp, auto-badging extension, fake document teardown, syndicate graph, proactive alert.	MAXIMUM
Real data backing	NCRB, ILO, MEA, NHRC, BBC — bulletproof evidence base. Not invented.	MAXIMUM
Scale narrative	140 million people. Rs. 1,500 crore. One WhatsApp number. Quotable in any pitch.	MAXIMUM
Social impact / SDG	SDG 8 (Decent Work), SDG 16 (Justice), SDG 10 (Reduced Inequalities). Hits every ESG framework.	MAXIMUM
Originality	No product in India does this intersection: WhatsApp + vernacular AI + government registry cross-check + multi-channel coverage.	MAXIMUM
Feasibility	Fully buildable in 24–36 hours with described stack. No hardware. No external dependency. Rs. 0 cost.	MAXIMUM
Post-hackathon potential	Clear path to NGO pilot, government partnership, and impact investment. Not a toy — a fundable product.	MAXIMUM

"You are not building a hackathon project. You are building the thing India should have had five years ago. Walk into that room knowing that."

NaukariSaathi | ■■■■■ ■■■■ | Hackathon 2025–26 Protecting India's 140 million migrant workers — one WhatsApp message at a time.
